

Priors

$$\beta_0 \sim \text{Normal}(0, 2.5)$$

$$\beta_1 \sim \dots$$

$$\beta_3$$

where latitude, forest
latitude: forest
rescaled first

SAMPLES AND DERIVED QUANTITIES

PS - here β_1 is illustrated as the slope (latitude) while β_2 is habitat (forest).

We actually fitted the model the other way around (habitat then latitude).

Iteration/ sample	Samples.				Derived quant.
	β_0	β_1	β_2	β_3	
1	11.2	-1.3	1.6	-0.2	Diff in species richness forest - bog $e^{(\beta_0 + \beta_2)}$ (forest) / $e^{(\beta_0 + \beta_2)}$ (bog)
2	15.6	-0.98	1.8	-0.3	
3					bog: e^{β_0} latitude: $e^{\beta_1 \text{ latitude}}$
